Toxoplasmosis was diagnosed in 8 children. A strain was isolated by i.p. injection into the white mouse. Giant forms observed in the first few intraperitoneal passages may have been manifestations of extracellular proliferation of toxoplasmas which have not yet been adapted.

AUTHORS: Dragomir, Ioan, Tripşa, Iosif, and Nardin, Mario, Engineers

TITLE: Research Work on Hydrogen Content Variation, in Steel Made in 1.5 and 3 Ton Electric Furnace

PERIODICAL: Metalurgia şi construcţia de maşini, 1959, Nr 9, pp 743-747 (RUM)

ABSTRACT: The authors point out that greater attention is paid to the gas contents of steel which in most cases is harmful to the mechanical properties of the product. The determination of the gas contents of steel has been a subject of study at the Polytechnical Institute of Bucharest, Department of Ferrous Metallurgy, since 1955, when the first chemical determinations of nitrogen in carbon steels were made. In 1958, a method was established for the determination of the hydrogen contents of steel by heating in vaccum. This method was used by the authors of this paper. The purpose of the article is to give an idea of the variation of the H contents of electric furnace cast

Research Work on Hydrogen Content Variation, in Steel Made in 1.5 and 3 Ton Electric Furnace

steel. The research was done with the cooperation of a Rumanian machine-building plant. In that plant a high percentage of scrap was obtained through the growth of steel in the molds, and it was thought that the possible cause was a high gas content. At the same time, the research presented in this article constituted a verification of the apparatus for determining hydrogen in steel of the Department of Ferrous Metallurgy (Catedra de Siderurgie). The gases are present in steel in gaseous form (in the pores, as solid solutions, or as separate solid phases). They penetrate into the steel during its preparation, originating in the gaseous medium of the furnace or in the charge or admixture materials. The solubility of gases in metals is discussed and its function of temperature presented in Equation 1. The allotropic state of the metals also influences the gas solubility. For example, in alpha iron, the solubility of hydrogen jumps at 900°C to 4.7

APPROVED FOR RELEASE: Friday, July 28, 2000 CIA-RDP86-00513R00041112000

milliliter per 100 gram. In the moment of melting, the solubility of H jumps from 14 to 25 ml per 100 g of iron. The speed of dissolving gases in metals depends on many factors such as the state of aggregation, the state of the surface, the crystalline structure, the degree of agitation of the liquid, the pressure and temperature of the gas. In the solid state, the permeability of the metals for the gases is determined by the crystalline structure of the metals. For example, alpha iron is more permeable for H than gamma iron is. This is explained by the fact that the gaps uniting neighboring interstices are larger for volume-centered networks than for a network with centered surfaces. This circumstance is used in the vacuum extraction of H from solid steel: it is recommended doing this process under the $\alpha \rightarrow \gamma$ allotropic transformation point. The diffusion rate of a gas through a metal depends on the partial pressure as shown in Equation 2. Among

APPROVED FOR RELEASE: Friday, July 28, 2000 CIA-RDP86-00513R00041112000

Research Work on Hydrogen Content Variation, in Steel Made in 1.5 and 3 Ton Electric Furnace

the gases dissolved at steel making temperatures is hydrogen, too. During the cooling down and especially during solidification, the solubility of the gases sinks, the gases leave the solution either in gaseous form or as chemical combinations. Hydrogen escapes mostly in molecular form. Some of the gas escaping during cooling remains within the steel-forming cavities which finally can cause a rejection of the material or cast part. In certain cases, the gases dissolved in steel escape under the action of mechanical or thermal processing and lead to the formation of cracks, flakes in the steel. In certain temperature conditions, the hydrogen present in solid solution in steel reacts with oxides, forming water vapors insoluble in steel-forming fissures called "hydrogen wounds". Hydrogen in solid solution lowers the plasticity of steel and titanium, etc. This disadvantage can be eliminated by annealing. The gases also influence the electric, magnetic, and

Card 4/9

APPROVED FOR RELEASE: Friday, July 28, 2000 CIA-RDP86-00513R00041112000

chemical properties of the alloys. For example, the hydrogen in transformer (electrical) steel sheets increases the energy losses in iron. The dissolved gases also lower the resistance of corrosion of the steel. There are several methods of determining the hydrogen contents of steel. The most adequate one is the method of extraction at high temperature in vacuum, the authors point out. The present research described was made to determine the hydrogen contents of steel, made in electric furnaces. The samples were taken from the liquid bath of the furnace. They were deoxidized with aluminum and poured into a special chill mold, as shown in Fig 1. That chill ensures an almost instantaneous solidification of the steel sample. Immediately after the filling of the chill the sample was hardened in water, and after 2 or 3 hours, the hydrogen contents were determined. If for some reasons the determination is not possible during that time, the samples have

APPROVED FOR RELEASE: Friday, July 28, 2000 CIA-RDP86-00513R00041112000

"APPROVED FOR RELEASE: Friday, July 28, 2000 CIA-RDP86-00513R0004111200

Research Work on Hydrogen Content Variation, in Steel Made in 1.5 and 3 Ton Electric Furnace

to be preserved in dry ice. All these measures were taken to prevent, as much as possible, the escaping of hydrogen from the steel. The short time was required, as it is known that hydrogen escapes even from steel at room temperature. Through heating in vacuum, the hydrogen diffuses to the outer part of the sample. The diffusion rate is expressed by Equation 3. The equation indicates that one of the main factors, influencing the diffusion process is the concentration gradient between the solid and the gaseous phase. Therefore, to extract as much hydrogen as possible from the steel, the partial pressure of the hydrogen must be lowered according to the residual hydrogen contents in the steel. Equation 4 shows the influence of the temperature on the diffusion process. The escaping of hydrogen passes through three stages: 1) Diffusion of H atoms from the depth of the sample to its surface; 2) Association of the atoms of H to molecules at

APPROVED FOR RELEASE: Friday, July 28, 2000 CIA-RDP86-00513R00041112000

"APPROVED FOR RELEASE: Friday, July 28, 2000 CIA-RDP86-00513R0004111200

Research Work on Hydrogen Content Variation, in Steel Made in 1.5 and 3 Ton Electric Furnace

the surface of the sample; 3) Dissorption of the H molecules. The determination was made at 620°C, that is within the alpha phase, at a pressure of 1 mm Hg column. The gas escaping at that temperature was up to 95% hydrogen. The authors give a description of the work method and apparatus. The samples were taken in three characteristic moments of over 20 charges: after melting, at the end of the boiling period, and before evacuation. The samples were carefully polished and washed in carbon tetrachloride and introduced through the opening 4 (represented in Fig 2), of a quartz tube. Then the vacuum was made, and the sample introduced to the heating zone, heated by the tube furnace 3. The heating was controlled through an amperemeter. The temperature was measured from time to time by means of a mercury thermometer and a Pt-Pt-Rh couple. The pressure was read on the mercury manometer 2. The sample was maintained in the heating zone until the pressure

APPROVED FOR RELEASE: Friday, July 28, 2000 CIA-RDP86-00513R00041112000

"APPROVED FOR RELEASE: Friday, July 28, 2000 CIA-RDP86-00513R0004111200

increase ceased. Then it was removed to the end of the quartz tube by means of an electromagnet, and the operation was repeated with the second sample, and so on. The H contents were calculated according to Formula 5. The carbon steel was made in 1.5-tons and 3-tons electric furnaces. Three of the 20 charges were eliminated from the results, as those charges has no normal character, due to the shortages of electrical energy supply. The variation of the H contents is represented in the Figs 3, 4, and 6. The variation of the degassing in function of the decarbonizing rate is shown in Fig 5. The authors reached the following conclusions: The charge must be carefully selected. It must not contain too much oily chip. Boiling - preferably short and intense - is an efficient means of lowering the gas in steel. The decarbonization ore must not be too moist. The period of deoxidation must be as short as possible. After the forming of the slag it is

TITLE: Studies on the viscosity and electric conductivity of Fe-P alloys in liquid state

SOURCE: Studii si cercetari de metalurgie, v. 10, no. 1, 1965, 5-29

TOPIC TAGS: electric conductivity, ferro alloy, phosphorus alloy, liquid metal, metal physical property, solid mechanical property

ABSTRACT: A report on the analysis of the viscosity and electric conductivity of Fe-P alloys in the liquid state, with phosphorus content varying from 0 to 25 percent. The determinations were made in a purified helium atmosphere. It was found that the alloys have a complex structure which varies in terms of the phosphorus contents. The variation of kinematic viscosity and electric conductivity in terms of the phosphorus contents was in agreement with the Fe-P equilibrium diagram. On the basis of the data, the author concludes that the phosphorus is present in the liquid iron in the form of quasi-molecular groups of the Fe_2P type. Orig. art. has: 11 figures, 20 formulas, and 2 tables. [JPRS]

TITLE: Use of compressed air for accelerating the smelting of steel in Martin furnaces 14

SOURCE: Metalurgia, no. 2, 1966, 61-64

TOPIC TAGS: smelting furnace, steel production process

ABSTRACT: The authors describe the experimental use of compressed air to speed up steel smelting. Depending on conditions, the productivity of the furnaces at the "23 August" Works increased from 10 to 18 percent, and fuel savings of 19.8 percent were obtained. Best results were obtained with a mixture of compressed air and oxygen. Orig. art. has: 3 figures, 1 formula and 3 tables. [Based on authors' Eng. abst.] [JPRS: 36,867]

Title : Experimental Rabies Caused by "Neurotropic" Fixed Virus.

Orig Pub : Zh. med. Akad. nauk RNP, 1954 (1955), 3, 37-79

Abstract : After passages of fixed rabies virus through suslik and mouse brain, the incubation period of intrabrain infection in these animals was shortened to 3-5 days. The virus virulence was increased upon peripheral introduction. The authors designated the strain obtained as "neurotropic". After 23 passages through rat brains of the street [?] rabies virus, the incubation period in intrabrain infection of animals was shortened to 5-6 days. After 16 passages of the same strain through suslik brains, disease in the infected animals began after

disease. After subcutaneous infection, the skin contains virus for the first 50 minutes and is of variable virulence after 24 hours. With removal of the infected portion of the skin after 50 minutes, by 24 hours later the virus penetrates the organism causing disease. Virus introduced into nasal apertures is found in the mucous membranes of the nose and olfactory organs after the beginning of clinical symptoms of disease. Street rabies virus after introduction into the brain is found at the point of introduction on the 7th day. In rabbits infected through the femoral muscles and killed after 24-72 hours, the sciatic nerve and the lumbar part of the spinal cord were free from virus. The neurotropic strain of fixed rabies virus acquired a greater ability to spread through the peripheral nervous system-- to cause septineuritis in animals infected through the brain and peripheral paths. The neurotropic strain of fixed virus, as well as the street rabies virus

introduced into skin or muscles of extremities of animals after resection of the sciatic nerve or after its treatment by alcohol, did not cause rabies disease in animals. In infected animals, however, a condition of immunity is formed to a subsequent intraocular introduction of fixed rabies virus which, in the authors' opinion, indicates the possibility of rabies virus spreading in the organism, by-passing neural paths.

Bucharest, Microbiologia, Parazitologia, Epidemiologia, Vol 11, No 5, Sep-Oct 66, pp 399-405.

Abstract [Authors' English summary modified]: The authors report a case of benign inoculation lymphoreticulosis with erythema nodosa in a 56-year old woman. The laboratory tests confirming the diagnosis included positive intradermal reactions with the psittacosis heteroantigen and with the specific antigen prepared from lymph node pus, complement-fixation and hemagglutination-inhibition tests, etc. Clinical and epidemiologic data showed the presence of a non-bacterial purulent inguinal adenopathy and close contact with cats.

Bucharest, Revista Sanitara Militara, Vol 62, No 4, Jul-Aug 66, pp 715-717.

Abstract: The author evaluates the results obtained in Rumania with the Rehn-Loewe method of treatment. Since 1951, a total of approximately 150 cases were treated, using three variants of the method. On the basis of the excellent results obtained, the author recommends the Rehn-Loewe method as the treatment of choice for recurring eventrations and hernias.

Title : The Influence of the Preparation (Miltown) which Blocks Thalamus Functions Upon the Secretion of ACTH

Orig Pub : Fiziol. norm. i patol., 1957, [illegible] 6, 900-904

Abstract : The administration of Miltown (M) to rats blocks the effect of insulin, leading to the decrease of the number of eosinophils in the blood, but does not change the analogic effect of ACTH. When introduced separately, M does not affect the amount of eosinophils. Hypoglycemia due to insulin is not inhibited by M. According to the authors, the introduction of M changes the secretion of ACTH, which indicates that this secretion is regulated by thalamus.

Title : Study of Reducing Action of Silver and Mercury on Phosphotungstic Reagent (Folin's Reagent).

Orig Pub : Studii si cercetari chem., 1957, 5, No. 3, 469-485

Abstract : It was established that metallic Ag and Hg, as well as their sols in an acid medium, reduced phosphotungstic acid in the presence of one of the following ions in the solution: I^-, Br^-, SCN^-, CN^-, Cl^- and F^-; the blue color, which develops on that occasion, obeys Beer's Law at the concentrations of Ag of 3 - 20 γ/ml, and of Hg of 4 - 28 γ/ml. The intensity of the color does not change in the duration of one hour. The rate of reduction increases with the rise in temperature

and increase in concentration of the activating ions and decreases in the series I^- - Br^- - SCN^- - CN^- - Cl^- - F^-. For the photometric determination of Ag^+ and Hg_2^{2+} (Hg^{2+}), 1 - 2 ml. of the solution to be analyzed and containing these ions is treated with 40% solution of CH_2O (1 ml.) in the presence of 0.4 ml. of 33% NaOH. To the produced sol 0.4 ml. of 30% H_3PO_4, 1 ml. of Folin's reagent (10 g of Na_2WO_4, 10 ml. of H_3PO_4 of spec. gr. 1.75 and 75 ml. of water are boiled using a reflux condensor and, after cooling, diluted with water to 100 ml.) and 1 ml. of KI solution (2% solution in the case of Hg or 50% solution containing 2% of NaOH in the case of Ag) are added, all is diluted with water to 10 ml. and photometered using a light filter S 66 in the case of Hg or the light filter S 72 in the case

TITLE: Economic Aspects of the Use of All-Metal Washers (Voprosy ekonomiki v ispol'zovanii metallicheskikh promychnovykh priborov)

PERIODICAL: Kolyma, 1957, Nr 7, pp 26-31

ABSTRACT: Experience with washers and an analysis of charts and graphs recording their performance led to the following conclusions: When the sand volume washed at any one washer site is small (up to 10,000 cubic meters), the assembling and dismantling costs and the depreciation and maintenance on the washer run extremely high. For this reason the expensive types of washers MPD-3, MPD-4, and MPD-5 should not be employed under such conditions; washer types MPD-2 and MPD-6 should be employed instead. Each set of all-metal washers must be used at two or more sites, types MPD-2 and MPD-6 at three sites, the MPD-3 at one site. The use of wooden washers under existing conditions is no more expensive and sometimes is even less expensive than the employment of all-metal washers. Thus, where dredging areas are located at great distances from one another and are
